

Power to the people, from the people.

Become self-sufficient with green power

Vépower[™]

Create your own energy community

With a Vépower solution, your community has a cheap and reliable supply of green power.

We offer a modular power solution that you can implement one household at a time all the way **up to a full community-scale microgrid**.

It also works for powering a farm, industrial facility, school or rural hospital. For every module you add, we connect the individual sites to begin forming a local microgrid.

Local electrification

Creating your own local solution has made it possible for rural and underserved communities to leapfrog the costly and lengthy work of establishing long distribution lines from far away power plants.

Connect with neighbouring communities

We hook up your microgrid to the **bigger grid if available**, and we can even connect your community's grid with neighboring communities.

With Vépower, your community owns its own power supply. Meet your own local power needs and take part in the green transition on a regional scale.

Local transition

Creating your own solution is also the fastest and cheapest way of transitioning for communities currently running on fossil fuels.

But what if I were to say to you that 25 years from now, the bulk of the energy you use to heat your home and run your appliances, power your business, drive your vehicle, and operate every part of the global economy will likewise be nearly free? That's already the case for several million early adopters.

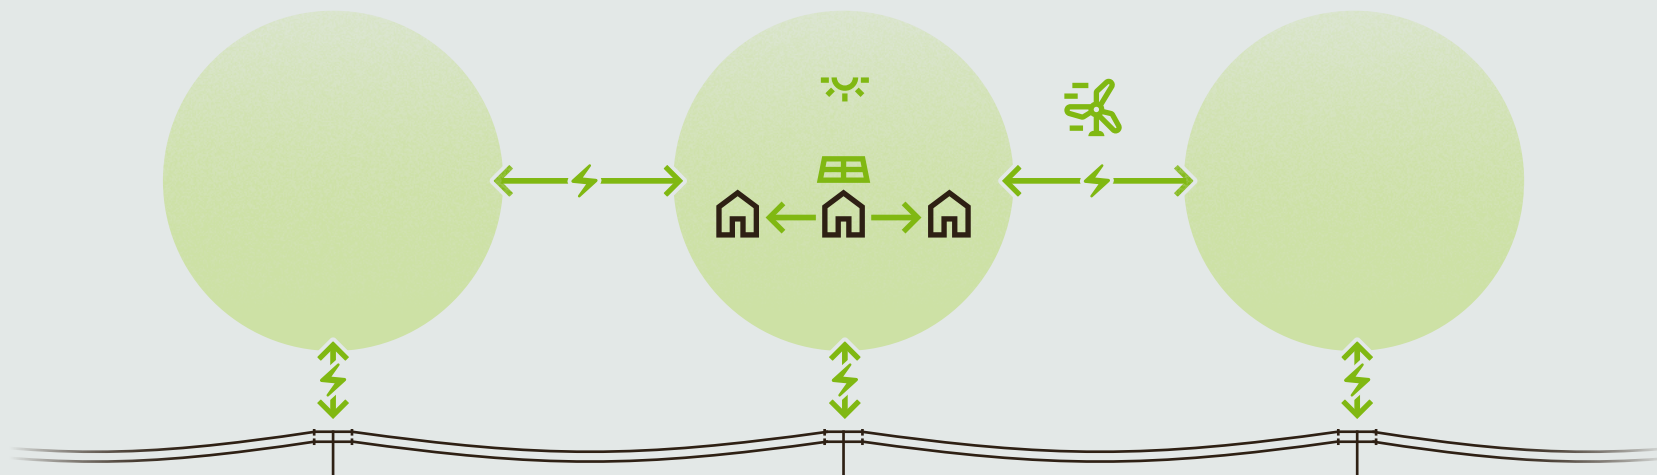

– Jeremy Rifkin
Economist

Growing with Vépower™

Most rural communities are being overcharged for unreliable power. With Vépower, you can supply yourself and your neighbours much less expensively.

You can even join forces with neighbouring energy communities, driving down costs even more for everyone.

Join together with your community, one household at a time or all at once, to become self-sufficient and earn extra by feeding your excess power back into the main grid.

»The Vépower™ model for electrifying local communities is the most practicable I've seen to date. It's modular, which means it can grow organically up to any scale, and it relies on community ownership, which means the community can organize around the shared goal of becoming energy self-sufficient.«

Humberto Valenzuela

Solar Power Engineer, Chile

A digital platform for reliable operations and community development

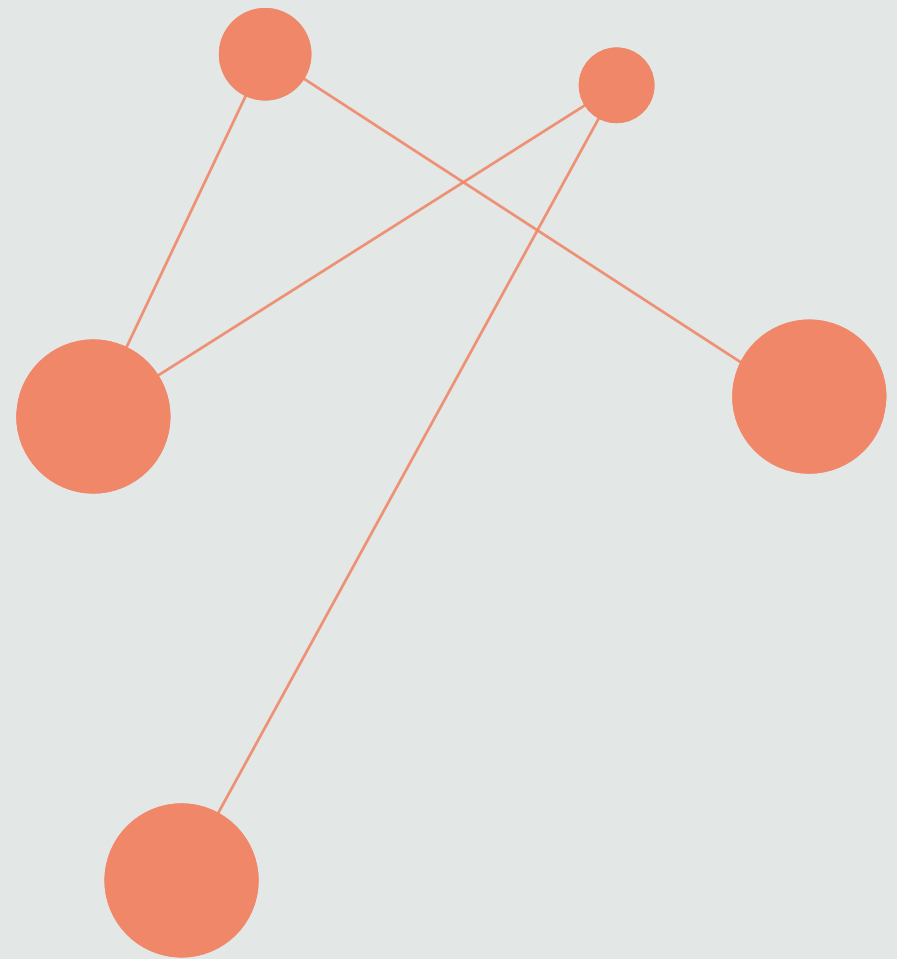

With our dedicated service platform, we can control, balance and optimize production and consumption to ensure the lowest cost of energy for the community.

Véhub™ uses cloud operations to continuously monitor and control your solution, and with a dedicated local service setup your solution is always reliable.

The heart of Véhub™ is *The Vé*, a forum in which you can discuss and develop the projects you want for your local community.

We can guide you on your journey to a flourishing green economy and offer many helpful tools for creating and financing real community development.
